

## Project Design Phase-I Solution Architecture

Date	19 September 2022
Team ID	PNT202200817
Project Name	Crude Oil Prediction
Maximum Marks	4 Marks

### Solution Architecture:

Solution architecture is a complex process – with many sub-processes – that bridges the gap between business problems and technology solutions. Its goals are to:

- Our Project is focused mainly on the use of Neural Networks to predict Crude Oil Prices. By making this prediction, we can buy crude oil at the most appropriate time. The most accurate way to predict future crude oil prices is to use time series analysis since we are using historical data on crude oil prices. In order to complete the task, we would implement a RNN (Recurrent Neural Network) in conjunction with a LSTM (Long Short Term Memory).

### Our Solution Architecture Diagram:
